

# MONTE MOTTARONE

## Ecological identification

It is the region with the highest level of biodiversity on a provincial scale for this taxonomic category, with 181 bird species reported, of which 72 are breeding. Regarding reptiles, the region is one of three provincial locations where *Natrix tessellata* is known to exist (Bionda et al., 2002). The area, which in the not distant past was extensively exploited agriculturally (pastures and limited mowing meadows), shows clear signs of abandonment, with widespread presence of forest of colonization and rich shrub layer. In areas adjacent to the wetlands, traces of cattle and goat grazing were found, with risk of trampling.

### Ecological and landscape strengths and fragilities
