THE MACCHIA MEDITERRANEA

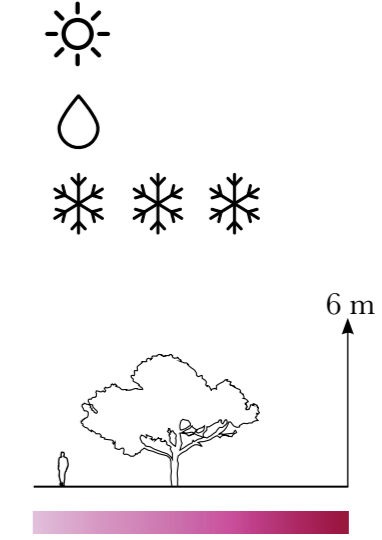

The colours and the continuity of nature seeking human wellness and ecosystem balancing

In order to obtain a continuity along the entire path also through the use of vegetation, the choice fell on the species of essences that can mainly satisfy the requirements of environmental condition and context, as guidelines, while for the different areas (pilot projects) all categories of plant selection were taken into account equally (environmental conditions, context, type of plant, interaction with people).

Before starting to select the project plants, careful research was carried out on existing biodiversity; in addition, an in-depth investigation was also conducted on the native plants (trees, shrubs, flowers) of Catalonia, and more specifically of the Maresme, to enhance this biodiversity already present and locate a new one that would interact perfectly with the existing one.

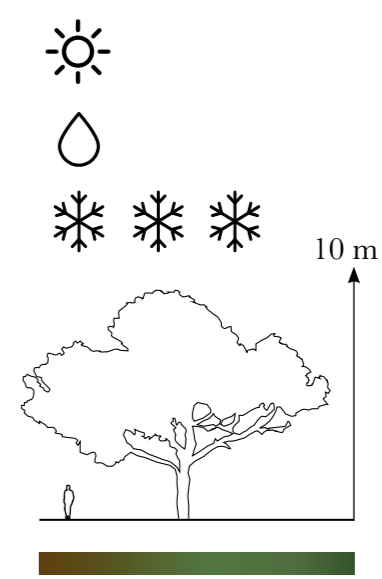

Along the route from the sea to the mountain, versatile plants have been selected, capable of adapting to different climates and ecosystems, from the mountain to the coastal one, with particular attention to the tamarisk, a striking example of this characteristic.

Tamarix Gallica

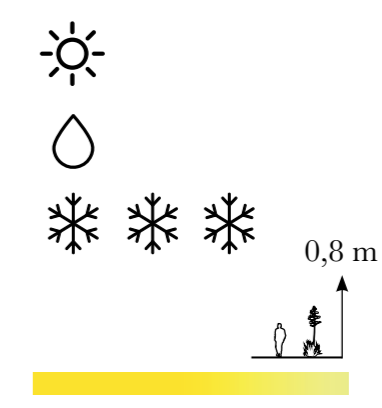

In addition to the tamarisk, along the ecological corridor that connects the Vilassar de Mar-Cabrera-Cabrils system, also including the Vilassar waterfront, there are also:

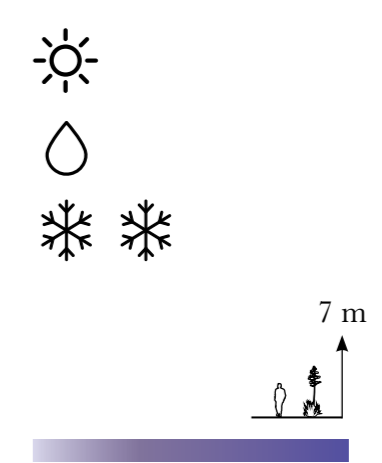

Pinus Pineae

Foeniculum vulgare

Lavandula

Cornus sanguinea
