

### Water in Persian garden:

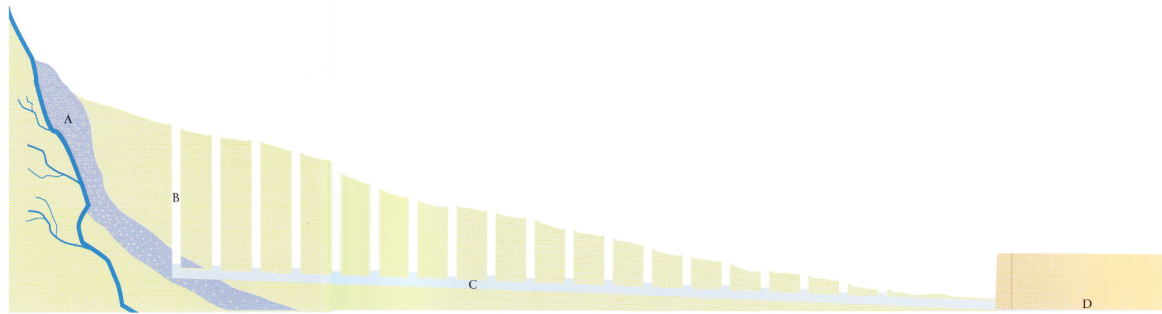

in Iran dry land water is scarce and valuable and looking at it especially in the morning and at the beginning of the month is auspicious.

Iranians provide water with suffering, use it with providence and skillfully display it in gardens with more than it is.

the main water source in Persian gardens is Qanat especially for gardens around deserts.

water enters the garden from one side, it circulates the whole garden, after irrigating all the plants and cooling the temperature of garden, it exits the garden and is directed to agricultural fields.

In Persian gardens since the water should appear more clear and cleaner than usual and also in hot summer days the water can easily be polluted with plants and Amoeba, the design should make the water circulate constantly especially when looking at a clean and clear water will induce coolness and joy to the viewers.

### Pool:

pools are one of the main elements of Persian gardens which are overfilled with water and are built higher than the ground level.

pools are usually deep and consisted of few water jets.
